

When Temperatures Rise, We Rise To The Occasion

As an application/installation, Data Centers provide an interesting challenge to the engineers designing the systems mitigating the heat transfer required for server farms and data centers; one of the fastest growing applications in the commercial valve marketplace. The conditions involved in most data centers are not particularly difficult, typically involving providing chilling service for equipment that is very sensitive to both high and low operating temperatures. But although these temperatures fall within the tolerances of most commercial/industrial valves, the nature of the services and the value of the equipment require that the system components be engineered to reduce any potential for failure or service interruption.

Milwaukee Valve offers a diverse selection of products that are utilized in data centers. High performance butterfly valves can handle it all, standing up to high temperatures and elevated pressures. From 2½"-48", all HP Butterfly Valves offer bi-directional bubble-tight sealing at up to 740 psi. Lug styles enable double dead-end service at full rated pressures. Outstanding reliability makes them the perfect choice for data centers and other mission-critical operations where failure could be catastrophic...and costly.

In addition to HP butterfly valves, Milwaukee also has provided actuators and controls to several data center projects. The pneumatic offering can automate ball and butterfly valves with torque values from 71 to 38,996 in-lb. Electric actuators are available in single and three-phase electrical supply to drive ball and butterfly valves with torque values ranging from 884 to 88,500 in-lb. This wide range provides great versatility and the simplicity of specifying one brand throughout your entire project.
